

SEED COATINGS

Alfalfa with 10% Ultra-Coat, Red shown here

ALL-VANTAGE[®]

Gives your seed every advantage possible!

ALL-VANTAGE[®] is an advanced seed coating system for superior application of legume inoculants, fungicide treatments, seed coloring, and nutrient packages to promote better stand establishment.

The **ALL-VANTAGE**[®] coating system begins with a specially formulated polymer, Adhere 108, that acts as a superior binding agent to provide consistent, uniform coverage of the seed. The special binding properties of Adhere 108 reduce dust-off of the coated seed and is completely safe to handle and transport. Coatings are available in the industry standards of 8-10% and 34%. Custom coatings are also available.

The **ALL-VANTAGE**[®] **Basic Coating** provides an efficient method of maintaining close association of the rhizobium inoculant to alfalfas, clovers, and other small seed legumes to assure the nitrogen-fixing potential of your crop. In addition to the legume inoculant, fungicides and/or a color can be added.

The **ALL-VANTAGE**[®] **Ultra-Coat** gives maximum visibility to seed with a wide range of metallic-like colors.

The **ALL-VANTAGE**[®] **Ferti-Coat** is a specially designed micronutrient package that can give your seed an added boost during germination and optimize emergence.
